AANSO205 is the gene sequence of the natural LTA gene. The LTA gene of the site directed mutant SDM1 (see AANSO206) is inactive. The inventors claim a vaccine prepn. active against pig scours which contains an inactivated LTA component, together with additional K88 antigens opt. with whole cells comprising the antigens or contg. the inactivated LTA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AANSO205 is the gene sequence of the natural LTA gene.                                                                                                                                                               The present sequence represents Escherichia coll heat-labile enterotoxin (LT) mutant LTS63Y. LTS63Y and LTdell10/112 (AAU00507)

are two novel detoxified and immunologically active proteins (LT mutants) derived by site-directed mutagenesis of the Al subunit of wild type LT. The substitution of Ser to Tyr at position 63 in LTS63Y blocks (AAD-binding. Deletion of Glu residues at position 63 in LTS63Y blocks (AAD-binding. Deletion of Glu residues at positions 110 and 112 in LTGell10/112 eliminate the enzymatic activity of LT. The Al subunit of wild type LT catalyses APD-ribosylation of Gs, a GTP-binding protein that regulates CAMP levels. The resulting increase in CAMP is the cause of darrhoea in humans and animals e.g. pags. The mucosal immunogenicities of mutant heat-labile endotoxins 17563Y and 17dell10/112 The control Groups of mice were immunised with LTS63Y or LTdell10/112. The control faccal antibody titres to LT were determined. The results showed that comparable level of anti-LT antibodies in sera and faccal extracts

immunogenic compositions, optionally comprising an adjuvant and/or a second immunogenic antigen. Such compositions can be administered to prevent/treat disease in a subject e.g. traveller's diarrhoea in humans. The protein or compositions are especially administered as vaccines useful to prevent or treat infections by enterotoxigenic strain of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a fragment of an Escherichia coil heat labile toxin subunit A (LT-A). This protein is used in a method resulting in a mutant LT-A protein which has the wild type Ala residue at position 72 changed to an Arg residue resulting in a toxin which retains its immunogenicity but is detoxified. Detoxification is defined in the specification as a reduction in toxicity relative to wild type toxin, such that any residual toxicity is sufficiently low to allow use as an effective immunogenic composition in humans without significant side effects. The protein can be combined with an acceptable carrier in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 STSLSLRSAHLAGQSILSGYSTYYIYVIATAPNMFNVNDVLGVYSPHPYEQEVSALGGIP 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 YSQIYGWYRVNFGVIDERLHRNREYRDRYYRNLNIAPAEDGYRLAGFPPDHQAWREEPWI 180

Detoxification is defined in the specification as a reduction in toxicity relative to wild-type toxin, such that any residual toxicity is sufficiently low to allow use ag an effective immunogenic composition in humans without significant side effects. The protein can be combined with an acceptable carrier in immunogenic compositions, optionally comprising an adjuvant and/or a second immunogenic antiques. Such compositions and edministered to prevent/treat disease in a subject e.g. traveller's diarrhoea in humans. The protein or compositions are especially administered as vaccines useful to prevent or treat infections by enterotoxigenic strain of

interpretation optimized CDRA. The recorded by a plant-condon optimized CDRA. The condon optimized CDRA. The condon optimized CDRA sequence contains plant-preferred codons and eliminates sequence motifs associated with sprucessing. A single codon insertion (GTG encoding valine) was made to accomcdate the creation of a NCoI restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible prophylactic or therapeutic treatment against B. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                     Heat-labile toxin; LT-B; mutant; transgenic plant; vaccine; oral; adjuvant; anti-bacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This synthetic Escherichia coli heat-labile toxin (LT) A subunit (LT-A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STSLSLRSAHLAGQSILSGYSTYXIYVIATAPNMFNVNDVLGVYSPHPYEQEVSALGGIP 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is mutant S63K Escherichia coli heat-labile toxin (LT) A subunit (LT-A). The wild-type serine was replaced with lysine at residue 63 of the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomodate the creation of a NcoI restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The
                                                                                                                                                                                                                          Heat-labile toxin; LT-A; LT-B; mutein; transgenic plant; vaccine; oral;

ö
polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coll or V. cholerae. The mutant polypeptides are also useful as adjuvants.

NB: This sequence does not appear in the specification, it was made from the wild type sequence shown in AAY96647, which appears in Figure 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Heat-labile toxin, LT-8, LT-B, mutant, transgenic plant, vaccine, oral, adjuvant, anti-bacterial, A72R.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŏ
                                                                                           This is muchan. Also Explained with arginine at residue 72 of the mature protein, which was caused by a nucleotide change of GC to GC the mature protein, which was caused by a nucleotide change of GC to GC the mature protein, which was caused by a nucleotide change of GC to GC the mature protein, which was caused by a nucleotide change of GC to be an arginial sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to accomodate the creation of a Noor restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant U.T.A polypeptide or a mutant vibrio cholerae cholera toxin (CT) a subunit (GT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or GT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide are useful for the cumprises a nucleic acid sequence encoding LT-B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transgenic plants to produce edible vaccines, especially oral vaccines in transgenic plants to cholerae. The mutant polypeptides are also useful as adjuvants.

Constructed from the wild type LT-A shown in AAV96646 which is given in Figure 1 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mutant; transgenic plant; vaccine; oral;

This is mutant R192G Escherichia coli heat-labile toxin (LT) A subunit (LT-A). The wild-type arginine was replaced with glycine at residue 192 of the mature protein, which was caused by a codon change of TCC to AAG in the coding sequence. The sequence contains plant-preferred codons and single codon insertion (GTG encoding value) was made to accomodate the creation of a NCOI restriction site around the initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant vibrio cholerae cholera toxin (CT) A subunit (GT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic coil sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the prophylactic or therapeutic cord and transgenic plants for the prophylactic or therapeutic cord meant against E. Coli or V. cholerae. The mutant polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents Escherichia coli heat-labile enterotoxin (LT) mutant LTdell10/112. LT563Y (AAU00506) and LTdell110/112 are two novel detoxified and immunologically active proteins (LT mutants) derived by site-directed antagenesis of the Al subunit of wild type LT. The substitution of Ser to Tyr at position 63 in LT563Y blocks (AP-binding. Deletion of Guu residues at positions 110 and 112 in the protein of Guu residues at positions 110 and 112 in the catalyses ADP-ribosylation of Gs, a GTP-binding protein that the LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that the LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that the capacity of LT. The All subunit of wild type LT catalyses ADP-ribosylation of Gs, a GTP-binding protein that the capacity of mutant heat-labile endotoxins LT563Y and LTdell10/112 were tested. C diroups of mice were immunised with LT563Y or LTdell10/112. The control groups received phosphate buffered saline (PBS) alone. The serum and faceal antibody titres to LT were determined. The results showed that the comparable level of anti-LT antibodies in sera and faceal extracts compared with those immunised with wild-type LT. The LT mutants are compared with those immunised with wild-type LT. The LT mutants are compared by the LT mutants are compared with those immunised with those immunised with those immunised with those immunised with the compared wit

This is Escherichia coli heat-labile toxin (LT) A subunit (LT-A) double mutant S63R-R192G. The wild-type serine was replaced with lysine at residue 63 and wild-type arguinne was replaced with lysine at residue 192 of the mature protein. The coding sequence contains plant preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to processing. A single codon insertion (GTG encoding valine) was made to accommodate the creation of a Ncol restriction site arcund the initiator methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants for the prophylactic from the propertion of the specification. It was constructed from the wild type LT-A shown in AAY96646 which is given in Figure 1 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

```
This is Escherichia coll heat-labile toxin (LT) A subunit (LT-A) double mutant A72R-R192G. The wild-type alanine was replaced with arginine at residue 72 and wild-type arginine was replaced with alginine at residue 20 of the mature protein. The coding sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. A single codon insertion (GTG encoding valine) was made to processing. A single codon insertion (GTG encoding valine) was made to methionine codon. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (GT-A) polypeptide, which have reduced enzyme activity as compared to the vild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the production of transgenic plants to produce edible
/note= "the wild type arginine is replaced by glycine
at position 192 of the mature sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     vaccines, especially oral vaccines in transgenic plants for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are also useful as adjuvants. Note: This sequence does not appear in the specification. It was constructed from the wild type LT-A shown in AAY96646 which is given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 STSLSLRSAHLAGQSILSGYSTYYIYVIATAPNMFNVNDVLGVYSPHPYEQEVSALGGIP 120

```
the E. coli heat labile toxin, an example of a bacterial ADP-ribosylating toxin. A mutant detoxified form of this protein is used in a parenteral adjuvant composition, which comprises the detoxified protein, at least one selected antigen and optionally a pharmaceutically acceptable (optionally topical) vehicle. The adjuvant composition can be administered parenterally in conjunction with at least one antigen in methods to immunise vertebrate subjects. The adjuvant has the ability to enhance the humoral and cell-mediated immune responses elicited by the antigen (e.g. by making the antigen more strongly immunogenic or necessitating fewer/lower antigen doses). It can be administered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      isolation from antigens as a boost following systemic or mucosal antigen administration. Most preferably, the adjuvant is co-administered with the antigen in the compositions and a pharmaceutically acceptable carrier. The antigen may be derived from viruses, bacteria, parasites and fungi or may be tumour antigens, self-antigens and allergens. The compositions are therefore useful in the treatment and prevention of e.g. viral diseases, allergic manifestations, diseases caused by pathogens (e.g. bacteria or parasites), Albs, autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence corresponds to the amino acid sequence of the A subunit of

```

```
This is the sequence of the A subunit of the heat labile toxin (LT-A) of a strain of E.coli known to affect humans. The sequence was published by Yamamoto et al., J.Biol. Chem., 259, 5037-5044. Mutations at selected positions within this sequence have been found to reduce toxicity (see AAR89730-R88732 and AAR44016-R44025). The invention relates to such immunogenic, detoxified proteins and their use in vaccines to protect against enterotoxigenic E.coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 STSLSLRSAHLAGQSILSGYSTYYIYVIATAPNMFNVNDVLGVYSPHPYEQEVSALGGIP 120

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU1255-AAU14009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (H1V-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-LIAI. The invention also relates to a method of identifying compounds that inhibit the formation of identifying compounds that inhibit the formation of a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107. and DP178 peptides. The method is useful for identifying compounds, in a reaction mixture containing DP107. Including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human present sequence represents a peptide sequence from Escherichia coli heat labile enterotoxin A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

As Map position: 1
C; Complex: the cholera enterotoxin molecule contains three kinds of chains; an alpha c; the chomplex: the chomplex: the choice is a chain to cate noncovalently with the subunit B, an aggregate of five beta chains C; Function:
A; Description: the active component of the toxin that is primarily responsible for C; Superfamily: heat-labile enterotoxin chain A
C; Keywords: enterotoxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            F.1-18/Domain: Signal sequence #status predicted <SIG>

C; Comment: Pertussis toxin contains five different chains, S1-S5. These are organized in c; Comment: Pertussis toxin contains of S2-S4 and S3-S4 are held together by S5. The genes C; Comment: Pertussis toxin causes irreversible uncoupling of the regulatory GTP-binding C; Comment: The substrates for the ADP-ribosyltransferase activity are the GTP-binding pt C; Comment: Pertussis toxin is the major virulence factor of B. pertussis.
C; Comment: See PIR:WBBRIP for version 2 of this sequence.
C; Superfamily: pertussis toxin chain S1

J. Mol. Biol. 258:661-671(1996).

- FUNCTION: SI IS AN NAL-DEPENDENT ADP-RIBOSYLTRANSPERASE. IT
CATALYZES THE ADP-RIBOSYLATION OF A CYSTEINE IN THE ALPHA SUBUNIT
OF HETEROTRIMERIC G PROTEINS. IN THE ABSENCE OF G PROTEINS IT ALSO
CATALYZES THE CLEAVAGE OF NAD(+) INTO ADP-RIBOSE AND NICOTINAMIDE.

IT IRREVERSIBLY UNCOUPLES THE G-ALPHA GTP-BINDING PROTEINS FROM
THEIR MEMBRANE RECEPTORS.

- SUBUNIT: PERTUSSIS TOXIN CONTAINS FIVE DIFFERENT CHAINS, S1-S5.

THEY ARE ORGANIZED INTO 2 FUNCTIONAL SUBUNITS: A, COMPOSED OF SI
(WHICH IS TOXIC) AND E, CONTAINING S2, S3, S5, AND TWO COPIES OF
S4 (B BINDS TO THE MEMBRANE RECEPTORS). DIMERS OF S2-S4 AND S3-S4
ARE HELD TOGETHER BY S5.

"Binding of Sulfosuccinimidyl fatty acids to adipocyte membrane proteins: isolation and amino-terminal sequence of an 88-kb protein implicated in transport of long-chain fatty acids.";

J. Membr. Biol. 133:49(1993).

-I-FUNCTION: SEEMS TO HAVE NUMBROSPONDIN, ANYONIC PHOSPHOLIPIDS AND OXIDIZED LDL. MAY FUNCTION AS A CELL ADHESION MOLECULE. DIRECTLY MEDIATES. CYTOADHERRUGE OF PLASMODIUM FALCIPARUM PARASITIZED BRYTHROCYPES. BINDS LONG CHAIN FATTY ACIDS AND MAY FUNCTION IN THE TRANSPORT AND/OR AS A REGULATOR AND ANY FUNCTION AND ACIDS AND MAY FUNCTION.

Submitted (SEP-1998) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Probably recognizes and binds to some phosphorylated proteins and promotes their ubiquitination and degradation.
-!- SUBUNIT: PART OF A SCF (SKP1-CULLIN-F-BOX) PROTEIN LIGASE COMPLEX (BY SIMILARITY).
